

A digital Platform for improving access to Maternal Health Care Services: MomCare.

By Nabasitu Erinah. BIT

A mobile and web-based application for improving access to maternal health-care services for the expectant mothers like, access to ambulance services, accessing health information related to pregnancy, making inquiries to the healthworkers. The above mentioned innovation was thought of during the Covid19 pandemic/period where the country was put on a total lockdown inorder to reduce the spread of Covid19 among people. This affected a number of sectors especially the health sector in the section of maternal health since many expectant mothers could-not move to the different health facilities to receive MHC services. therefore, this motivated us to come-up with a mobile and web-based system that will enable expectant mothers have access to the recommended MHC services at anytime thus reducing on the Maternal mortality ratio in Uganda and also reducing on the gap between expectant mothers and health-practitioners.
